

VerifyNow System

*In a world full of information,
VerifyNow helps you trust what you see.*

Detect

Identify unverified
or suspicious content

Verify

Cross-check with reliable
sources and technology

Trust

Get clear results you
can rely on

VerifyNow System

Helping **Information Seekers** Verify. Trust with Confidence.

Introduction

VerifyNow is a system designed to help **information seekers** verify online information and detect misleading content.

The system analyzes links and documents using **trusted sources** and **verification APIs**, then provides **verification results** with a **confidence level**.

Submit Link
or Document

Analyze &
Verify

Show Result &
Confidence

Budget Estimation (6–9 Months)

Hosting & Cloud Services
(Cloud, APIs)

\$1,500 – \$2,500

UI/UX Design

\$2,000 – \$2,500

Testing, Optimization &
Initial Maintenance

\$1,000 – \$1,500

Approximate Total

\$15,500 – \$25,000

Empowering information seekers
for a safer digital world.

Built for information seekers
who value truth and trust.

Supporting safer and more
reliable digital information sharing.

Requirements

- Information Seekers need to enter a link to verify its information.
- Information Seekers should see the confidence level of the result.
- Information Seekers should receive a warning if the information is misleading or untrustworthy.
- Information Seekers should be able to use the system easily without any technical knowledge.
- Information Seekers should be able to report incorrect results.
- Information Seekers should see a brief explanation of how the result was determined.

Context model

 The system receives diverse content (links, text, or images) from the Information Seeker and generates comprehensive final verification reports

 It actively interacts with Social Media Platforms to request source IDs and retrieve post context details for deep analysis

 The system utilizes Search Engines to perform Reverse Search Queries and extract critical metadata and data information

 It communicates with Fact-Check APIs by sending validation requests and receiving match results to ensure information credibility

 The final result helps users identify whether the content is trustworthy or misleading

Planning & Risks

FirewallTasks & Milestoness

- Weeks 1–7: SRS & UML Modeling (M1–M2).
- Weeks 8–21: Core Backend & Frontend Development.
- Weeks 22–29: System Validation & Testing.
- Weeks 30–32: UAT Completion & MVP Release.

Schedule & Dependencies

- Applied Effort: Included Person-Weeks for resource balance.
- Task Linkage: There are clear dependencies between tasks (e.g. T4 depends on T2).
- Enhanced Scale – Gantt Chart now displaying an accurate weekly scale.

Risks & Mitigation

- Inaccurate Results: Use multiple reliable API sources.
- Data Security: OAuth for access tokens.
- System Reliability: Automated backups & redundancy protocols

Development Model

VerifyNow follows a Plan-Driven Model, ensuring high reliability and clear milestones over a 32-week lifecycle.

why?

- Clear requirements from the beginning
- Better documentation and scheduling
- Suitable for academic projects
- Easier progress tracking
- Helps reduce development risks

Test Cases

Test Case 2:

Misleading Information Detection

- The user submits misleading information.
- The system analyzes the content.
- A warning message is displayed as “Not Verified”.

Test Case 1:

Reliable Information Verification

- The user submits a reliable news link.
- The system analyzes the content.
- The verification result is displayed as “Verified”.

Software requirements

- **Software tools and APIs**
- **Web-based technologies**

Hardware requirements

- **Personal Computers / Laptops**
- **No specialized hardware required**

Conclusion

VerifyNow helped us apply software engineering concepts to a real-world misinformation verification system.

System Status

- Completed SRS and UML models
- Defined system workflow and requirements
- Project still requires full implementation and integration

Future Enhancement

- Improve verification accuracy
- Support more trusted sources
- Develop a mobile application
- Enhance UI/UX
